KEYWORDS: Antibiotic resistance; Quorum Sensing; LsrK inhibition; DPD-related compounds

#### Abstract

Antibiotic resistance is posing a continuous threat to global public health and represents a huge burden for society as a whole. In the last decade, the interference with bacterial Quorum Sensing (QS) (i.e., cell-cell communication) mechanisms has extensively been investigated as a valid therapeutic approach in the pursuit of a next generation of antimicrobials. (S)-4,5-dihydroxy-2,3pentanedione, commonly known as $(S)$-DPD, a small signaling molecule that modulates QS in both

Gram-negative and Gram-positive bacteria, is phosphorylated by LsrK kinase and the resulting phospho-DPD activates QS. However, DPD is characterized by very low water stability, an aspect which limits its utility as a tool compound to study QS. Herein we present our efforts towards the discovery of novel effective antibacterial agents active as QS modulators via a LrsK inhibitory mechanism. We designed and prepared a small library of DPD derivatives, characterized by five different scaffolds and evaluate their LsrK inhibition in the context of QS interference. To this aim, a luciferin-based assay was developed to test our molecules. SAR studies highlighted the pyrazole moiety as an essential structural element for LsrK inhibition. Particularly, four compounds were found to be micromolar LsrK inhibitors ( $\mathrm{IC}_{50}$ ranging between $100 \mu \mathrm{M}$ and $500 \mu \mathrm{M}$ ). Altogether, the LsrK inhibitory activity of the synthesized compounds is encouraging for further exploration of novel analogues in antimicrobial drug development.

## 1. INTRODUCTION

Quorum Sensing (QS) is a cell-cell communication strategy that allows bacteria to act as a population by coordinating their gene expression. ${ }^{1-5}$ QS regulates different pathogenic processes such as biofilm formation, ${ }^{6-8}$ susceptibility to antibiotics ${ }^{9}$ and virulence factor production. It is therefore not surprising that QS modulation has emerged in the last decade as a potential tool to fight antibiotic resistance. ${ }^{10-13}$ QS is mediated by the exchange of small signaling molecules termed autoinducers (AIs). Oligopeptides and $N$-acyl homoserine lactones (AHLs) are the most common QS mediators in Gram-positive and Gram-negative bacteria, respectively, while Autoinducer-2 (AI-2) features in both classes. Targeting AI-2-mediated QS would therefore result in broad spectrum antimicrobial activity. The precursor of AI-2, ( $S$ )-DPD, is biosynthesized intracellularly in a three steps pathway. $S$-adenosylmethionine (SAM) is demethylated by a methyltransferase to generate the toxic intermediate $S$-adenosylhomocysteine (SAH). In LuxS-containing organisms, the enzyme Pfs removes adenine from SAH to form $S$ rybosylhomocysteine (SRH). Lastly, LuxS breaks down SRH into adenine and (S)-DPD. LuxS synthase is found in more than 70 evolutionary different bacterial species indicating that AI-2 mediates both inter- and intraspecies communication. ${ }^{14}$ The neo-synthetized (S)-DPD is released extracellularly with an unclear mechanism which might involve the membrane protein YdgG (Figure 1) ${ }^{15,16}$. Outside the cell membrane, linear $(S)$-DPD spontaneously rearranges into the two cyclic isomers $S$-DHMF and $R$-DHMF (Figure 1). ${ }^{17}$ The aqueous environment allows for their hydration at $\mathrm{C}_{3}$ to form the two cyclic tetrahydrated isomers $S$-THMF and $R$-THMF (Figure 1). X-ray crystallography revealed that $S$-THMF, in the form of the borate ester $S$-THMF-borate, binds to the periplasmic protein LuxP ${ }^{18}$ activating QS in $V$. harveyi. In enteric bacteria, when a threshold level of AI-2 in the extracellular medium is reached, $(R)$-THFM is imported via the $\operatorname{Lsr}(\underline{L u x} \underline{S} \underline{r} \underline{\text { regulated }})$ ACBFG transporter ${ }^{19}$ and its linear form (i.e., STHP) is phosphorylated by LsrK. The resulting S-THP-phosphate, commonly known as phospho-DPD (P-DPD, Figure 1), binds to the transcriptional repressor $\operatorname{LsrR}^{20}$ that dissociates from the promoter
region of the $l s r$ operon, initiating the operon transcription. As a result, the expression of the transporter on the cell surface is increased as well as the internalization of AI-2 and the QS response (Figure 1). ${ }^{21}$ Ultimately, P-DPD is processed by LsrG and LsrF to close the AI-2 signaling cycle. LsrG catalyzes PDPD isomerization to 3,4,4-trihydroxy-2-pentanone-5-phosphate (P-TPO, Figure 1$)^{22}$ while LsrF acts as a thyolase and transfers an acetyl group from the hydrated form of P-TPO to coenzyme A to form dihydroxyacetone phosphate (DHAP, Figure 1) and acetyl-CoA (Figure1). ${ }^{22}$ Considering the complexity of the mechanism and its regulation, there is a great interest of the pharmaceutical community in identifying new compounds able to modulate QS to control bacterial virulence and reduce its negative effects, including mortality. ${ }^{23-25}$ To lay the foundation for the rational design/discovery of QS modulators/inhibitors, several attempts to crystallize QS receptors have been performed. LuxP from $V$. harveyi has been co-crystallyzed with $S$-THMF-borate (PDB ID: 1JX6 ${ }^{18}$ ) while its isomer, $R$-THMF, has been solved in complex with the LsrB transporter (PDB ID: 1TJY ${ }^{19}$ ). Lastly, the linear hydrated form of ( $S$ )-DPD has been shown to bind to the transcriptional repressor LsrR (PDB ID: 4L4Z ${ }^{20}$ ).

Figure 1: Biosynthesis, transport and degradation of ( $S$ )-DPD in enteric bacteria
To date, several structure-activity relationship (SAR) studies have been carried out around the DPD backbone and the effects of substitution at the $\mathrm{C}_{1}$ position have been reported. ${ }^{26-32}$ However, the exploration of new compound classes that are structurally distinctive from native DPD is needed to discover new antibacterial agents. In this study, we report on the design, synthesis and SAR of novel DPD-related compounds (Figure 2) with different "core structures", involving modifications at the DPD diketo moiety. In particular, we explored five small libraries of DPD-inspired heterocyclic derivatives (Het-DPD derivatives, Figure 2). Lastly, the in vitro inhibitory effect of the new compounds against LsrK kinase has been evaluated. Results obtained suggested that Het-DPD derivatives act as LsrK inhibitors and their analogs may be considered as useful templates for the discovery of new effective DPD-based antimicrobial agents. To the best of our knowledge, these are the first heterocyclic-based LsrK inhibitors reported to-date.

## 2. RESULTS AND DISCUSSION

### 2.1 Compounds design

LsrK belongs to a family of carbohydrate kinases called "FGGY family" whose members transfer a phosphate group from ATP to several sugars ranging from trioses to heptoses. ${ }^{33}$ In enteric bacteria, phosphorylation of DPD by LsrK represents the prerequisite activating step for AI-2 signaling. Modulation/inhibition of LsrK could therefore potentially attenuate AI-2-related pathogenesis and LsrK could be a new and attractive anti-infective target to further explore.

Previous studies evidenced that both the hydroxyl groups at $\mathrm{C}_{4}$ and $\mathrm{C}_{5}$ of DPD (Figure 2) are essential for phosphorylation. It has been demonstrated that DPD is phosphorylated at position five and that phosphorylation occurs only when the hydroxyl group at $\mathrm{C}_{4}$ is not derivatized. ${ }^{34}$ Starting from these considerations, we herein designed new DPD-related compounds where the portions essential for LsrKmediated phosphorylation (i.e., the two hydroxyl groups at $\mathrm{C}_{4}$ and $\mathrm{C}_{5}$ ) are kept constant while the
diketo moiety of DPD is embedded in heteroaromatic rings. With the final aim to investigate the chemical space of compounds structurally related to DPD, we focused our attention on different heterociclyc scaffolds decorated with aliphatic and/or aromatic moieties (Schemes $1-4$ ). Particularly, isoquinolines, pyridines, pyrimidines and pyrazoles were selected, given their high frequency of occurrence in several natural or synthetic drugs used for their antibacterial ${ }^{35,36}$, antifungal ${ }^{37-40}$ anticancer ${ }^{41-44}$ and anti-inflammatory ${ }^{45-47}$ properties, just to cite a few.

### 2.2 Synthesis

Target compounds (Schemes $1-4$ ) can be easily prepared applying our recently developed protocol, starting from intermediate 1 bearing an ethyne group, suitable for further chemical diversification. ${ }^{48}$ The synthesis of monosubstituted isoquinolines-Het-DPD derivatives (Figure 2, series A) was accomplished via a one pot, microwave-assisted, palladium-catalyzed strategy, coupling alkyne $\mathbf{1}$ with $o$-bromoaldehydes. The resulting Sonogashira products were reacted with ammonium acetate as imination reagent and then deprotected (Scheme 1). Briefly, alkyne $\mathbf{1}$ was dissolved in DMF and then $\mathrm{Pd}(\mathrm{OAc})_{2}, \mathrm{PPh}_{3}, \mathrm{KOAc}$ and the appropriate $o$-bromoaldehyde were added. The reaction mixtures were irradiated at $80^{\circ} \mathrm{C}$ for $1-2$ hours, ammonium acetate was added and the resulting mixtures were irradiated again at $150^{\circ} \mathrm{C}$, thus affording the desired protected products $\mathbf{3 a - g}$ (Scheme 1). Heteroaromatic $o$-bromoaldehydes (i.e., 3-bromo-2-formylfuran 2e, 3-bromothiophene-2-carbaldehyde 2f and 5-bromo-2-methyl-4-thiazolecarboxaldehyde $\mathbf{2 g}$ ) led to isolation of the corresponding furopyridine, thienopyridine and thiazolopyridine derivatives $\mathbf{3 e}$-f. Final acidic treatment yielded the monosubstituted isoquinolines-Het-DPD derivatives 4a-g (Scheme 1).

Scheme 1: Synthesis of monosubstituted isoquinolines-Het-DPD derivatives 4a-g. Reagents and conditions: (a) 2a-g ( 0.9 eq ), $\mathrm{Pd}(\mathrm{OAc})_{2}(1.8 \% \mathrm{~mol}), \mathrm{PPh}_{3}(3.6 \% \mathrm{~mol}), \mathrm{KOAc}(1.8 \mathrm{eq}), \mathrm{DMF}, \mathrm{mw}, 80$ ${ }^{\circ} \mathrm{C}, 1 \mathrm{~h}-2 \mathrm{~h}$; ( $\mathrm{a}^{\prime}$ ) $\mathrm{NH}_{4} \mathrm{OAc}(1.8 \mathrm{eq}), \mathrm{MW}, 150^{\circ} \mathrm{C}, 2 \mathrm{~h}-3 \mathrm{~h}$; (b) 12 M HCl (cat.), 1,4-dioxane, $0^{\circ} \mathrm{C}$ to rt, $1 h-3 h$

Sonogashira coupling ${ }^{43}$ of terminal alkyne 1 with acyl chlorides, followed by addition of amidinium salts to the corresponding ynones and final acidic removal of the acetal protecting group provided rapid access to 2,4,6-trisubstituted pyrimidines-Het-DPD derivatives (Figure 2, series B). Benzoyl chloride $\mathbf{5 a}$ was selected to screen three different conditions for the synthesis of ynone 6a. Surprisingly, copper-, ligand- and solvent-free acylation ${ }^{50}$ as well as the use of a mixture of $\mathrm{PdCl}_{2}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{2}$, Sphos and $\mathrm{Cs}_{2} \mathrm{CO}_{3}{ }^{26}$ did not furnish the desired product. Good results were obtained with the copper- and palladium-catalyzed system proposed by Karpov et al. ${ }^{49}$ which allowed us to obtain compound $\mathbf{6 a}$ with a yield of $87 \% .{ }^{51}$ Three different ynones (6a-c) were reacted with six different amidinium salts and the resulting products $\mathbf{7 a - f}$ treated under acidic conditions (i.e., Scheme 2, conditions $\mathbf{c}$ ) to afford the 2,4,6trisubstituted pyrimidines-Het-DPD derivatives 8a-f with moderate to excellent yields (i.e., $43 \%-$ 82\%).

Scheme 2: Synthesis of 2,4,6-trisubstituted pyrimidines-Het-DPD derivatives 8a-f. Reagents and conditions: (a) 5a-c (1.5 eq), $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(9 \% \mathrm{~mol}), \mathrm{CuI}(3 \% \mathrm{~mol}), \mathrm{Et}_{3} \mathrm{~N}(1.25 \mathrm{eq}), \mathrm{THF}$, rt, overnight; (b) $\mathrm{R}_{2} \mathrm{NHNH}_{2} * \mathrm{HCl}\left(1.2\right.$ eq), $\mathrm{Na}_{2} \mathrm{CO}_{3} * 10 \mathrm{H}_{2} \mathrm{O}\left(3.0\right.$ eq), $40{ }^{\circ} \mathrm{C}$, overnight; (c) 12 M HCl (cat.), $1,4-$ dioxane, $0^{\circ} \mathrm{C}$ to $\mathrm{rt}, \mathrm{h}-3 \mathrm{~h}$

The 2,3,4,6-tetrasubstituted pyridines-Het-DPD derivatives (Figure 2, series C) were easily obtained following the one-pot, three-component and acid-free methodology developed by Bagley et al. This heteroannulation combines a Michael acceptor with a nucleophile in the presence of an excess (10.0 eq) of ammonium acetate (to generate, in situ, the enamine). ${ }^{52}$ Ethyl acetoacetate was selected as nucleophile to have an additional diversification point (i.e., the carboxylic ester moiety) and reaction with 6a (i.e., the Michael acceptor) in refluxing ethanol provided intermediate 9 a with $92 \%$ yield (Scheme 3). Tetrasubstituted pyridines $\mathbf{9 a}$ and $\mathbf{9 b}$ (from ynone $\mathbf{6 b}$ ), were hydrolyzed in basic conditions and then treated with hydrochloric acid to give target compounds 11a-b with excellent yields (i.e., $80 \%$ and $72 \%$, respectively).

Scheme 3: Synthesis of 2,3,4,6-tetrasubstituted pyridines-Het-DPD derivatives 11a-b. Reagents and conditions: (a) Ethyl acetoacetate ( 10.0 eq ), $\mathrm{EtOH}, 50^{\circ} \mathrm{C}$, overnight; (b) $1 \mathrm{M} \mathrm{NaOH}(3.0 \mathrm{eq}), \mathrm{EtOH}, 0$ ${ }^{\circ} \mathrm{C}$ to rt, overnight; (c) 12 M HCl (cat.), 1,4-dioxane, $0^{\circ} \mathrm{C}$ to $\mathrm{rt}, 1 \mathrm{~h}-3 \mathrm{~h}$

The synthesis of 3,5-disubstituted (series D) and 1,3,-5-trisubstituted pyrazoles-Het-DPD derivatives (series E) started with the production of three additional aliphatic (i.e., isopropyl, cyclopentyl and adamantane $\mathbf{6 d - f}$ ) and one aromatic (i.e., furanyl $\mathbf{6 g}$ ) ynones. Each of these seven ynones ( $\mathbf{6 a - g}$ ) was reacted with two different hydrazines (i.e., hydrazine and methylhydrazine) to generate, respectively, 3,5-disubstituted (12a-g) and 1,3,5-trisubstituted (13a-g) protected pyrazoles. Final acidic deprotection afforded the targeted products 14a-g and 15a-g with excellent yields (i.e., $67 \%-92 \%$, Scheme 4).

Scheme 4: Synthesis of 3,5-disubstituted and 1,3,5-trisubstitted pyrazoles-Het-DPD derivatives 14a-g and 15a-g. Reagents and conditions: (a) $\mathrm{R}_{1} \mathrm{COCl}(1.5 \mathrm{eq}), \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(9 \% \mathrm{~mol}), \mathrm{CuI}(3 \% \mathrm{~mol}), \mathrm{Et}_{3} \mathrm{~N}$ (1.25 eq), THF, rt, overnight; (b) $\mathrm{R}_{2} \mathrm{NHNH}_{2}$ (1.3 eq), EtOH, rt, overnight; (c) 12 M HCl (cat.), 1,4dioxane, $0^{\circ} \mathrm{C}$ to $\mathrm{rt}, 1 \mathrm{~h}-3 \mathrm{~h}$

### 2.3 Screening of LsrK Kinase inhibitors

All the prepared compounds were assayed for inhibitory activity against LsrK at $200 \mu \mathrm{M}$ concentration. Unexpectedly, only four compounds (belonging to series D and series E) among the 29 prepared, resulted effective in inhibiting LrsK. Compounds 12a, 12b (series D) and 13a, 13b (series E) showing an inhibition percentage higher than $40 \%$, were retested at different concentrations (Table S1, SI) and their $\mathrm{IC}_{50}$ values calculated. In Figure 3 the dose-response curves together with the $\mathrm{IC}_{50}$ values of compounds 12a, 12b, 13a, 13b are reported.

Figure 3: Dose-response curves against LsrK for compounds 12a, 12b, 13a, 13b. Data points represent the mean $\pm$ SD of two independent experiments $(\mathrm{n}=4)$

To evaluate the specificity of compounds $\mathbf{1 2 a}, \mathbf{1 2 b}, \mathbf{1 3 a}, \mathbf{1 3 b}$, these were further tested against glycerokinase, which has high sequence similarity (i.e., $41.2 \%$ ) to LsrK. None of the compounds showed activity against glycerokinase (Figure S1, SI). To sum up, pyrazole-containing DPD derivatives emerged as the most interesting LsrK inhibitors among the series under investigation.

## 2. Structure-Activity Relationship (SAR) studies of pyrazole-containing DPD derivatives

The results of the first LsrK kinase screening highlighted the pyrazole moiety as the most promising scaffold. Accordingly, we further explored the 1,3,5 trisubstituted pyrazole series (series E), applying our synthetic protocol which permits an easy access to molecular diversity at three different diversification points, as outlined in Figure 4. Based on synthetic feasibility and commercial availability of the starting materials, nineteen new $1,3,5$ trisubstituted pyrazole derivatives have been prepared by installing different aliphatic and aromatic substituents at position one (Scheme 5) and three (Scheme 6) as well as by replacing at position five the acetal protecting group with aliphatic rings of different sizes (Scheme 7). Moreover, the acetal moiety was removed (compound 18, Scheme 7).

$\sqrt{6}$

Figure 4:Further diversification of 1,3,5 trisubstituted pyrazolic compounds

For modification at $\mathrm{N}_{1}$ the effects of aliphatic (linear, branched and cyclic) and aromatic substituents on bioactivity were investigated. The synthesis of this second set of 1,3,5-trisubstituted pyrazoles-HetDPD derivatives ( $\mathbf{1 6 a - f}$ ) started from ynone 6a to which was added an excess (1.3 eq) of the corresponding hydrazine.

Scheme 5: Synthesis of the first new set of 1,3,5-trisubstituted pyrazoles-Het-DPD derivatives 16a-f. Reagents and conditions: (a) $\mathrm{R}_{1} \mathrm{NHNH}_{2}$ (1.3 eq), EtOH , rt, overnight

Several analogues where the phenyl at position three of the pyrazole nucleus was replaced with other aliphatic, aromatic and heteroaromatic rings were then studied. Compounds 16h-o (Scheme 6) were readily prepared by condensation of seven new ynones synthetized by us with methylhydrazine.

Scheme 6: Synthesis of the second new set of 1,3,5-trisubstituted pyrazoles-Het-DPD derivatives $\mathbf{1 3 h}$ o. Reagents and conditions: (a) $\mathrm{R}_{1} \mathrm{COCl}(1.5 \mathrm{eq}), \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(9 \% \mathrm{~mol}), \mathrm{CuI}(3 \% \mathrm{~mol}), \mathrm{Et}_{3} \mathrm{~N}(1.25$ eq), THF, rt, overnight; (b) $\mathrm{MeNHNH}_{2}$ (1.3 eq), EtOH , rt, overnight

Lastly, to study the relevance of the two oxygens on biological activity, we prepared compound $\mathbf{1 8}$, were the oxigen atoms were completely removed. Additionally, derivatives 22a-d, bearing acetal substituents with different steric properties were also synthesized. Compound $\mathbf{1 8}$ was prepared reacting benzoyl chloride 5a with 1-propyne 17 and the resulting ynone $\mathbf{6 p}$ with methylhydrazine as previously described (Scheme 7A). By reaction of the diol 19 with an excess ( 3.0 eq ) of the corresponding ketone and a catalytic amount of $p$-TSA in neat conditions, further acylation with 5a and condensation with methylhydrazine the desired five new pyrazoles-Het-DPD 22a-d (Scheme 7B) were obtained. It has to be noted that 4-piperidone was found not to be suitable for our purpose as the free basic nitrogen impeded the Sonogashira coupling with benzoyl chloride while $N$-acetylpiperidone did not show any reactivity issue and compound $\mathbf{2 2 d}$ could be isolated with $44 \%$ yield.
A)

B)

Scheme 7: A) Synthesis of compound 18. Reagents and conditions: 5a (1.5 eq), 17 ( 1.0 eq ), $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(9 \% \mathrm{~mol}), \mathrm{CuI}(3 \% \mathrm{~mol}), \mathrm{Et}_{3} \mathrm{~N}(1.25 \mathrm{eq}), \mathrm{THF}, \mathrm{rt}$, overnight; (b) $\mathrm{MeNHNH}_{2}(1.3 \mathrm{eq})$, EtOH, rt, overnight. B) Synthesis of the third new set of 1,3,5-trisubstituted pyrazoles-Het-DPD derivatives 22a-d. Reagents and conditions: (c) Ketone (3.0 eq), p-TSA (cat.), rt, overnight

All the prepared $1,3,5$ trisubstituted pyrazoles-Het-DPD were assayed for inhibitory activity against LsrK at $200 \mu \mathrm{M}$ concentration, according to the protocol previously described. ${ }^{53}$ Obtained results confirmed that the presence of the oxygen atoms at position 5 of the pyrazole moiety is essential for the binding to Lsrk and that acetals derivatives have a better profile respect to the corresponding diols. Overall, the results indicate that the most active LsrK inhibitor is compound 13a, bearing a methyl group at $\mathrm{N}_{1}$, a phenyl group at $\mathrm{C}_{3}$ and an acetal moiety at position five.

### 2.5 Molecular modeling studies

To support the SAR analysis and to inspect the molecular basis of their binding to LsrK kinase, all the compounds were docked into the substrate binding site of the LsrK crystal structure (PDB ID: 5YA1). Docking poses were analyzed for the interactions and geometry. The docking analysis is in line with
the activity of pyrazole containing (series $\mathbf{D}$ and series E) DPD derivatives. Compounds 12a and 13a, differing only in the presence of $\mathrm{N}_{1}-\mathrm{CH}_{3}$, showed similar binding poses. Compound 13a formed a hydrogen bond interaction with Thr 275 (which might be involved in the substrate phosphorylation reaction) and 12a with Phe 276 and Gln 278 (Figure S2, SI). The corresponding less active furanyl derivatives $\mathbf{1 2 b}$ and 13b show similar binding poses except the pyrazole ring flip, which is caused by the bulky $\mathrm{N}_{1}-\mathrm{CH}_{3}$ group. The better activity of compound 13a having phenyl substitution at $\mathrm{R}_{1}$ with respect to the furan substitution in 13b (Figure 5) can be explained by the negative electrostatic potential of the oxygen of the furan ring and the local binding site environment (i.e., Thr 456 residue contributing to the electrostatic repulsion). The activity of 13a can also be attributed to the methyl stabilization energy of $\mathrm{N}_{1}-\mathrm{CH}_{3}$.

Figure 5. Compound 13a (left) and 13b (right) binding pose in the LsrK kinase binding site. Hydrogen bond interactions (red dashed line) are shown along with active site residues. Electrostatic potential surfaces were presented as mesh (blue-positive potential and red-negative potential)

Regarding the effect of the modification at the diol moiety, acetal compounds have the non-polar cyclohexane ring that can form electrostatic interactions with the surrounding environment (of negative charge potential) and diol compounds bind to the active site in opposite orientation to acetals (Figure S3, SI). Here, the diol group is located towards the negative electrostatic potential surface of the
binding site (Glu 454 and Thr 456) which may have led to repulsion that resulted in weak binding of diols compared with acetals. To sum up, acetals gave better interaction with the protein respect to the corresponding diols in each series. This data are in accordance with the in vitro experiments.

## 3. CONCLUSIONS

Resistance to antibiotics is constantly increasing and it is estimated that, by 2050, multidrug resistant bacteria will kill more than cancer. ${ }^{54}$ In the last decade, modulation of QS has become an attractive therapeutic strategy to fight bacterial resistance. Two different DPD-related compounds (i.e., isobutylDPD and phenyl-DPD) have already shown their activity in combination with gentamicin and small molecules able to modulate/inhibit QS are therefore considered interesting "non-conventional" tools to be used in combination with classical antibiotics. ${ }^{10-13}$

As a continuation of our recent findings, where, applying a virtual screening approach we were able to identify 2 -substituted amino benzoic acids as LsrK inhibitors, in this communication, we report for the first time on the " $a d$ hoc" design and synthesis of potential LrsK inhibitors structurally related to DPD. The medicinal chemistry efforts presented in this work provided 48 Het-DPD derivatives, characterized by different heterocyclic scaffolds and led to the identification of effective representatives characterized by in vitro Lsrk enzymatic activity $\left(\mathrm{IC}_{50}\right)$ in the micromolar range. All the target compounds have been easily prepared in maximum four synthetic steps, thus allowing to easily explore the chemical space of DPD. Remarkably, four compounds displayed $\mathrm{IC}_{50}$ values between 100 $\mu \mathrm{M}$ and $500 \mu \mathrm{M}$, evidencing the 3,5-disubstituted and 1,3,5 trisubstituted pyrazole structures as the best scaffolds. Moreover, an in-depth SAR campaign was performed, synthetizing other nineteen 1,3,5 trisubstituted pyrazole analogues. The systematic ligand-based approach and SAR studies, led to the identification of compound 13a, with an $\mathrm{IC}_{50}$ value of $119 \mu \mathrm{M}$ as a promising $H i t$ for future chemical development of novel LsrK inhibitors. Future work in our laboratory will focus on a hit-to-lead process
to increase LsrK inhibition by further diversification and functionalization of the heterocyclic core and the evaluation of these novel derivatives for their potential as QS-interfering compounds in the treatment of bacterial infections.

## 4. EXPERIMENTAL SECTION

### 4.1 Chemistry

Chemicals and solvents were obtained from commercial suppliers and were used without further purification. All dry reactions were performed under nitrogen atmosphere using commercial dry solvents. Flash column chromatography was performed on a silica column using 230400 mesh silica gel or Grace Reveleris X2 flash chromatography system using silica gel packed Macherey Nagel Chromabond Flash BT cartridges $(60 \AA, 45 \mu \mathrm{~m})$ and Grace Reveleris flash Cartridges ( $60 \AA, 40 \mu \mathrm{~m}$ ). Thin layer chromatography was performed on Macherey Nagel precoated TLC aluminum sheets with silica gel 60 UV254 ( $5 \mu \mathrm{~m}-17 \mu \mathrm{~m}$ ). TLC visualization was accomplished by irradiation with a UV lamp (254 nm) and/or staining with $\mathrm{KMnO}_{4}$ solutions. ${ }^{1} \mathrm{H}$ NMR spectra were recorded at room temperature on a Bruker Avance spectrometer operating at 300 MHz . Chemical shifts are given in ppm ( $\delta$ ) from tetramethylsilane as an internal standard or residual solvent peak. Significant ${ }^{1} \mathrm{H}$ NMR data are tabulated in the following order: multiplicity ( s , singlet; d , doublet; t , triplet; q , quartet; m , multiplet; dd, doublet of doublets; dt, doublet of triplets; td, triplet of doublets; br, broad), coupling constant(s) in hertz, number of protons. Proton decoupled ${ }^{13} \mathrm{C}$ NMR data were acquired at 100 MHz . 13C chemical shifts are reported in parts per million ( $\delta, \mathrm{ppm}$ ). All NMR data were collected at room temperature $\left(25^{\circ} \mathrm{C}\right)$. Analytical, preparative HPLC and Electron Spray Ionization (ESI) mass spectra were performed on an Agilent UHPLC (1290 Infinity) and an Agilent Prep-HPLC (1260 Infinity) both equipped with a Diode Array Detector and a Quadrupole MS using mixture gradients of formic acid/water/acetonitrile as solvents. High-resolution electrospray ionization mass spectra (ESI-FTMS) were recorded on a Thermo LTQ Orbitrap (high-resolution mass spectrometer from Thermo Electron) coupled to an 'Accela' HPLC system supplied with a 'Hypersil GOLD' column (Termo Electron).

### 4.2 General procedures for the synthesis of monosubstituted isoquinolines and derivatives (Series A)

Synthesis of 3a-g: $1(1.0 \mathrm{eq}), \mathrm{Pd}(\mathrm{OAc})_{2}(1.8 \% \mathrm{~mol}), \mathrm{PPh}_{3}(3.6 \% \mathrm{~mol}), \mathrm{KOAc}(1.8 \mathrm{eq})$ and the corresponding 2-bromoaryl(heteroaryl)aldehyde ( 0.9 eq ) in dry DMF were mixed in a 5 mL microwave vial under $\mathrm{N}_{2}$ atmosphere. The mixture was stirred at $80^{\circ} \mathrm{C}$ under microwave irradiation until starting material disappearance (usually $1-2$ hours). After cooling to room temperature, $\mathrm{NH}_{4} \mathrm{OAc}$ ( 2.0 eq ) was added and the mixture was stirred at $150{ }^{\circ} \mathrm{C}$ under microwave irradiation until disappearance of the corresponding Sonogashira product (usually $2-3$ hours). The mixture was diluted with EtOAc and washed five times with water. The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. The crude was redissolved in ACN $(1 \mathrm{~mL})$, filtered and purified by preparative HPLC. ${ }^{55}$

### 4.3 General procedures for the synthesis of 2,4,6-trisubstituted pyrimidines (Series B)

Synthesis of 6a-p: to a stirred solution of $\mathbf{1}(1.0 \mathrm{eq})$ in dry THF were added $\mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(9 \% \mathrm{~mol})$, $\mathrm{CuI}(3 \% \mathrm{~mol})$ and the corresponding acyl chloride ( 1.5 eq ). The reaction was stirred at room temperature for 2 minutes under $\mathrm{N}_{2}$ atmosphere. $\mathrm{Et}_{3} \mathrm{~N}$ (1.25 eq) was added and the mixture was stirred at room temperature overnight. Solvent was removed under reduced pressure, the crude redissolved in EtOAc and washed three times with water. The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo to yield the corresponding ynone. The products were used without being purified.

Synthesis of 7a-f: to a stirred solution of the corresponding ynone (1.0 eq) in THF was added $\mathrm{Na}_{2} \mathrm{CO}_{3}$ ( 2.4 eq ) and the corresponding amidine hydrochloride ( 1.2 eq ). The mixture was stirred at reflux overnight. Solvent was evaporated under reduced pressure, the crude was redissolved in EtOAc and washed three times with water. The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. The crude was redissolved in ACN $(1 \mathrm{~mL})$, filtered and purified by preparative HPLC. ${ }^{56}$

Synthesis of 8a-f: a stirred solution of the protected pyrimidine7a-f in 1,4-dioxane was cooled to $0^{\circ} \mathrm{C}$ using an ice bath. A catalytic amount of concentrated HCl was added. The reaction was stirred at room temperature for $1-3$ hours. Solvent was evaporated under reduced pressure, the crude was redissolved in ACN (1 mL), filtered and purified by preparative HPLC.

### 4.4 General procedures for the synthesis of 2,3,4,6-tetrasubstituted pyridines (Series C)

Synthesis of 9a-b: to a stirred solution of the corresponding ynone ( 0.6 eq ) and ethyl acetoacetate (1.0 eq) in EtOH was added $\mathrm{NH}_{4} \mathrm{OAc}(10.0 \mathrm{eq})$. The mixture was stirred at reflux overnight. Solvent was removed under reduced pressure, the crude was redissolved in EtOAc and washed three times with $\mathrm{NaHCO}_{3}$ (saturated solution). The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. The crude was redissolved in ACN $(1 \mathrm{~mL})$, filtered and purified by preparative HPLC. ${ }^{52}$

## ethyl 6-cyclopropyl-4-\{1,4-dioxaspiro[4.5]decan-2-yl\}-2-methylpyridine-3-carboxylate

brown oil, $87 \%, R_{f}=0.50(\mathrm{CyH} / E t O A c 9: 1)$, UHPLC-ESI-MS: $R_{t}=3.42, m / z=346.2[\mathrm{M}+\mathrm{H}]^{+} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.21(\mathrm{~s}, 1 \mathrm{H}), 5.13(\mathrm{t}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.40-4.33(\mathrm{~m}, 3 \mathrm{H}), 3.64(\mathrm{~d}, J=7.8$ $\mathrm{Hz}, 1 \mathrm{H}), 2.50(\mathrm{~s}, 3 \mathrm{H}), 2.08-1.99(\mathrm{~m}, 1 \mathrm{H}), 1.82-1.73(\mathrm{~m}, 2 \mathrm{H}), 1.70-1.59(\mathrm{~m}, 6 \mathrm{H}), 1.48-1.44(\mathrm{~m}$, $2 \mathrm{H}), 1.37(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.01-0.97(\mathrm{~m}, 4 \mathrm{H}) \mathrm{ppm} ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 168.4,164.2$, $155.5,148.1,123.0,114.4,110.6,74.5,70.9,61.4,35.8,34.8,25.1,23.9,23.8,23.6,17.5,14.2,10.1$ ppm.

Synthesis of 10a-b: a stirred solution of 9a-b in EtOH was cooled to $0^{\circ} \mathrm{C}$ using an ice bath. 1 M $\mathrm{NaOH}(3.0 \mathrm{eq})$ was added dropwise. The mixture was stirred at reflux overnight. Solvent was evaporated under reduced pressure, the crude was redissolved in DCM and extracted with water. The aqueous layer was acidified with 1 M HCl until $\mathrm{pH}=1$ and extracted three times with $\mathrm{CHCl}_{3} / i-\mathrm{PrOH}$ (7:3). The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. The crude was redissolved in ACN (1 mL), filtered and purified by preparative HPLC.

4-\{1,4-dioxaspiro[4.5]decan-2-yl\}-2-methyl-6-phenylpyridine-3-carboxylic acid (10a): yellow oil, $80 \%, R_{f}=0.23\left(\mathrm{CHCl}_{3} / \mathrm{MeOH} 9: 1\right)$, UHPLC-ESI-MS: $R_{t}=2.76, m / z=354.2[\mathrm{M}+\mathrm{H}]^{+} .{ }^{1} \mathrm{H}$ NMR $(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.01(\mathrm{~d}, J=7.3 \mathrm{~Hz}, 2 \mathrm{H}), 7.92(\mathrm{~s}, 1 \mathrm{H}), 7.53-7.43(\mathrm{~m}, 3 \mathrm{H}), 5.34(\mathrm{t}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H})$,

### 4.5 General procedures for the synthesis of 3,5-disubstituted (Series D) and 1,3,5-trisubstituted pyrazoles (series E)

Synthesis of 12a-g and 13a-g: to a stirred solution of the corresponding ynone (1.0 eq) in EtOH (2 mL ) was added the corresponding hydrazine (hydrazine monohydrated or methyl hydrazine) (1.3 eq). The mixture was stirred at room temperature until starting material consumption (monitored by TLC) (normally $2-3$ hours). Solvent was removed under reduced pressure, the crude was redissolved in ACN ( 1 mL ), filtered and purified by preparative HPLC. ${ }^{57}$

Synthesis of 14a-g and 15a-g: a stirred solution of the protected pyrazole 12a-g and 13a-g in 1,4dioxane was cooled to $0^{\circ} \mathrm{C}$ using an ice bath. A catalytic amount of concentrated HCl was added. The reaction was stirred at room temperature for $1-3$ hours. Solvent was evaporated under reduced pressure, the crude was redissolved in $\mathrm{ACN}(1 \mathrm{~mL})$, filtered and purified by preparative HPLC.

Synthesis of 20a-d: to $\mathbf{1}(1.0 \mathrm{eq})$ was added the corresponding ketone ( 3.0 eq ) and a catalytic amount of $p$-TSA was added. The reaction was stirred at room temperature overnight. The solvent was removed under reduced pressure and the crude was re-dissolved in $\mathrm{Et}_{2} \mathrm{O}$ and washed three times with $\mathrm{NaHCO}_{3}$. The organic layer was dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo to yield the corresponding terminal alkynes. The products were used without being purified.

### 4.2 Biology

## LsrK overexpression and purification

LsrK from S. typhimurium was overexpressed in E. coli MET1158 [E. coli, amp resistance, BL21 (DE3) luxS-, with pMET1144 (lsrK-His in pET21b) ${ }^{58}$, kindly donated by Prof. Karina Xavier (Instituto Gulbenkian de Ciência, Portugal), according to a previously reported protocol. ${ }^{53}$

## Primary screening and dose response experiments

Each compound was initially tested against LsrK at $200 \mu \mathrm{M}$. Compounds were plated in triplicate and 300 nM LsrK, $300 \mu \mathrm{M}(S)$-DPD and $100 \mu \mathrm{M}$ ATP, diluted in assay buffer ( 25 mM triethanolamine, pH 7.4, $200 \mu \mathrm{M} \mathrm{MgCl}_{2}$ and $0.1 \mathrm{mg} / \mathrm{ml} \mathrm{BSA}$ ). After 15 mintes of incubation, Kinase Glo Luminescence kit's (Promega, USA) reagent was added according to manufacturer's instructions. Luminescence was recorded after 30 minutes with Varioskan LUX plate reader (Thermo Fisher Scientific, Finland). Compounds showing an inhibition $>40 \%$ were tested in a dose-response experiment against LsrK at 6 different concentrations $(25 \mu \mathrm{M}-500 \mu \mathrm{M})$. The assay was carried out as reported above, except for the addition of Triton X -100 to the assay buffer to prevent potential aggregation. $\mathrm{IC}_{50}$ values were determined using the four parameters logistic function in Origin 8.6.

## Glycerokinase assay

Compounds active against LsrK were also tested against glycerokinase to evaluate their selectivity. 0.3 $\mathrm{U} / \mathrm{ml}$ glycerokinase from E. coli (Sigma-Aldrich, USA) and $300 \mu \mathrm{M}$ glycerol were added to plate followed by $100 \mu \mathrm{M}$ ATP. The assay was performed according to the LsrK inhibition assay protocol.

### 4.3 Molecular Modelling

All the computations were carried out using Schrödinger suite 2018-1. ${ }^{59}$ The crystal structure of LsrK kinase (5YA1) was downloaded from RCSB PDB. The protein structure was prepared using protein
preparation wizard of Schrödinger so that both ATP and substrate were included in the process. Hydrogens were added to the structure using default settings. Missing loops and side chains (residues 363-372, located far away from the active site) were filled using Prime. Water molecules more than $5 \AA$ away from the ATP and substrate atoms were deleted. Hetero atom ionization states were generated, optimized and then minimized. The active site was defined for grid generation for docking based on the substrate coordinates. All synthesized compounds were prepared suing Ligprep module in Schrödinger. Ionization states were generated using Epik. Tautomers and stereoisomers were generated retaining the specified chiralities. Prepared ligands and protein were used as input for docking in Glide module of Schrödinger. Docking was done using standard precision mode in Glide.
